## DETAILED ACTION

#### Response to Arguments mailed 9/28/2010

#### **Applicant Argues:**

- (P1) Amended independent claims 38 and 55 are patentably distinguishable over the cited art in that they recite either an architery or method for monitoring quality of service in a telecommunication network including a set of mobile terminals having "at least one measuring agent configured to interface with processes selected from a group of processes for managing application sessions of said telecommunication network and processes for measuring operating conflictions of said telecommunication network." The method also involves scheduling quality of service measuring campaigns and "configuring, for executing said defined measuring campaign, at least one measuring service some successions of the processes.
- (P2) Applicant has proposed amending independent claims 38 and 55 and related dependent claims to clairly that the recited "terminals" are "hobito terminals." The basis of these amendments is evident both from the specification and from dependent claims 41 and 55, which have now been canceled. These amendments help to further distinguish the present invention from Menon and Korhonan.
- (P3) For example, in the Final Office Action, the Examiner appears to map the "terminats" recited in claims 38 and 55 attendately to "network nodes 856" or "base stations 30 or 101" in Menon. Final Office Action at 3-5. Menon generally discloses "a telecommunication system supporting wireless access that can handle both packet data and voice transmissions." Menon ¶ [0009]. Menon discloses that its telecommunication system comprises four sub-networks: a core packet data network, an Internet Protocol packet voice network, an Internet Protocol packet voice network, and internet Protocol packet voice network, and internet Protocol packet voice network, and internet Protocol packet voice network and internet voice network and internetwork and internetwork and i
- (P4) Indeed, with respect to former claims 41 and 58, which recited that the "set of terminals comprises at least one mobile terminal," the Examiner contends that Wenon meets this recitation by sickosing a wireless network. Final Office Action at 6, 21 ("see Menon, paragraph 0027, "FIG. 13 depicts a generic management protocol architecture protocol for management of a network node in a wireless access network". But disclosure of a "wireless access network". But disclosure of a "wireless access network" but disclosure of a "wireless" access network and the protocol architecture of the pr
- (P5) Accordingly, Applicant respectfully submits that <u>Menon fails</u> to teach or suggest the claimed "set of mobile terminals, each mobile terminal of said set of mobile terminals housing at least one measuring agent" and "a scheduling module for scheduling quality of service measuring campaigns, said scheduling module identifying a subset of said set of mobile terminals..., and configuring, for executing said defined measuring campaign, at least one measuring agent housed by each mobile terminal of said subset," as required at least by Applicant's amended independent claim 38.

#### Examiner Responds:

Menon discloses and suggests the "mobile terminal" as the independent claims now recite. More specifically, paragraph 052 states that "In an embodiment, a network subscriber terminal 21, or simply terminal 21, comprises a PC and a CPRU 25".

Therefore, clearly a "mobile terminal" is described as the "terminal" comprises a "customer premise radio unit" (i.e. a transmitter / receiver for wireless communication) and a "PC" (i.e. a computation device). By comprising a "terminal" with a

Art Unit: 2473

"transmitter/receiver" and a "computation device" Menon discloses and suggests the "mobile terminal" of applicant's independent claims. Furthermore, Menon discloses a "wireless network" to which the "terminals" connect to. As such, Menon discloses and suggests the features recited in the independent claims. Examiner believes that applicant's concerns have been addressed and arguments fully responded to.

#### Applicant Argues:

In addition, the proposed amendments further distinguish the independent claims from <u>Menon and Korthonan in</u> that they incorporate the subject matter of former claims 75 and 76. Specifically, independent claims 38 and 55 now require that a measuring agent manages an application session to derive therefrom a set of measurement data with each mobile terminal further comprising.

an elaboration agent configured to pre-process said set of measurement data derived from said application session; and a communication agent configured to send said set of pre-processed measurement data to said management and confliquration subsystem.

Again, in rejecting claims 75 and 76, the Examiner maps the claimed subject matter to "network nodes 856" in Menon. which are not "mobile terminals." Accordingly, the proposed amendments to claims 38 and 55 to incorporate the subject matter of claims 75 and 76 even further distinguishes them from the cited art.

In other words, <u>Kurhonen</u> only discloses that a user equipment's monitoring agent may request quality of service parameters to be provided to the racida occess network or core network, instead of disclosing "a celeduling module for scheduling quality of service measuring campaigns, said scheduling module identifying a subset of said set of mobile terminats, and configuring, for executing said defined measuring campaign, at least one measuring agent housed by each mobile terminal of said subset," as required by Applicant's amended independent claim 38.

# Examiner Responds:

It appears applicants are, again, arguing that Menon does not disclose the "Mobile Terminals". The examiner, in the above-written response has addressed this. That is, Menon does disclose the "Mobile Terminals" in paragraph 052 states that "In an embodiment, a network subscriber terminal 21, or simply terminal 21, comprises a PC and a CPRU 25". Therefore, clearly a "mobile terminal" is described as the "terminal" comprises a "customer premise radio unit" (i.e. a transmitter / receiver for wireless

communication) and a "PC" (i.e. a computation device). By comprising a "terminal" with a "transmitter/receiver" and a "computation device" Menon discloses and suggests the "mobile terminal" of applicant's independent claims. The Examiner believes that applicant's arguments have been overcome and fully addressed.

#### Applicant Argues:

In the final Office Action, claims \$1 and 68 were rejected under \$3 U.S.C. § 103(a) as being unpatentable over Menon in view of Köchnoan and unther in view of Beillemine, Claims \$5 and 68 depend from amended independent claims \$8 and 55, which are allowable over Menon in view of Kochnoan for at least the reasons outlined above. Beillemine, does not remedy the decliencies of Menon and Konhoan outlined above, because it falls to disclose or render obvious, at least, a "set of mobile terminals, each mobile terminal of said set of mobile terminals housing at least one measuring agent" and "a scheduling moduling quality of service measuring campaligns, add escheduling moduli of the scheduling moduli of the scheduling said vertice measuring campaligns, and scheduling moduli of the scheduling would be retrieved in the scheduling would be service measuring said scheduling would be serviced in the scheduling would be serviced in a policy scheduling would be serviced be serviced in a policy scheduling would be serviced be serviced by the scheduling would be serviced be serviced by the scheduling would be serviced by the scheduling wou

Examiner nesponds.

Applicant's arguments fail to comply with 37 CFR 1.111(b) because they amount
to a general allegation that the claims define a patentable invention without specifically
pointing out how the language of the claims patentably distinguishes them from the
references.

#### Applicant Argues:

Furthermore, Applicant respectfully points out that the final Office Action presents new arguments as to the application of the art against Applicant's claims. It is respectfully submitted that entry of the Amendment would allow the Applicant to rely to the new arguments and place the application in condition for allowance. Examiner Responds:

It is respectfully noted that applicants provided new claims 75 and 76 preceding the final action. As such, new claims for examination were presented by applicant and as such new arguments were provided with appropriate citation. The examiner believes applicant's concern has been fully addressed.

Art Unit: 2473

## Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

1. Claim 74 of the invention are directed to non-statutory subject matter such as a carrier wave - which is transitory. The specification and instant claims do not specify for the 'computer readable medium' to be 'non transitory computer readable medium'. It is respectfully requested that applicant append 'non transitory' to the term 'computer readable medium' so that it reads as 'non transitory computer readable medium' so as to overcome to 35 USC 101 rejection.

# Claim Rejections - 35 USC § 103

 The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

 Claims 38-50, 52-67, and 69-76 rejected under 35 U.S.C. 103(a) as being unpatentable Menon (US 2001/0001268) in view of Korhonan (EP 1 304 831 A2)

#### Menon discloses:

Regarding claim 38, <u>An architecture</u> (see Menon; figure 1; "SMP" and "75") for monitoring quality of service (see Menon; paragraph 0182; "The

Art Unit: 2473

subscriber management procedure 160 generates and supports network management access to subscriber information including, but not limited to. subscriber profiles, subscription activity and subscriber account balances. In an embodiment, subscription profiles include, but are not limited to. customer identification, customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned. In an embodiment, subscription activity information includes, but is not limited to, respective subscribers' usage, in time, of service supported by the wireless access system 10, or 100,") in a telecommunication network (see Menon; abstract; "telecommunications network") comprising: a set of mobile terminals (see Menon: abstract: "a base station which provides wireless access for CPRUs" which are terminals; figure 16; multiple "Customer Premise Radio Units"), each mobile terminal of said set of mobile terminals housing at least one measuring agent (see Menon; paragraph 0185; "Each node manager 854. in turn, manages two or more network nodes 856. The network nodes 856 comprise the CPRUs 25, base stations 30, ... "; figure 13; "Node (agent)" houses "SMP" which is the "subscriber management procedure 160 generates and supports network management access to subscriber information including, but not limited to, subscriber profiles ... subscription profiles include, but are not limited to, customer identification, customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned.") configured to interface with

applications (see Menon; paragraph 0168; "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications ... for purposes including, but not limited to, trouble-shooting and error management, asset management and system. service and functionality analysis": paragraph 0188: "sports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management. Likewise, the agent applications layer 841 of the node element protocol stack 840 supports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management.") and a management and configuration subsystem (see Menon; figure 9; "depicts management platforms within the management structure"; paragraph 0160; "network management"; paragraph 0146; "accounting management") comprising a scheduling module (see Menon; paragraph 0170; paragraph 0169: "subscriber registration module") for scheduling quality of service measuring campaigns (see Menon; paragraph 0170; "subscriber registration procedure 152 includes ... collection, storage, and management of subscriber, i.e. customer, data ... subscriber data includes, but is not limited to, a subscriber profile ... example of a parameter associated with a subscriber profile is a Quality of Service (QoS) level subscribed for, or

Art Unit: 2473

otherwise assigned"; paragraph 0227; "perform a measurement collection functionality ... measurement collection functionality includes, but is not limited to, a determination of the uplink quality and signal strength to each base station ... the availability and usage of base station's over-the-air resources") said scheduling module identifying a subset of said set of mobile terminals (see Menon; paragraph 02227; "on each base station 30 or 101 for all used") according to a set of identifying characteristics of a defined measuring campaign (see Menon; paragraph 0227; "the measurement collection functionality includes, but is not limited to, a determination to the uplink radio quality and signal strength on each ...") and configuring, for executing said defined measuring campaign, at least one measuring agent housed by each mobile terminal of said subset according to said set of identifying characteristics (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting") wherein each mobile terminal of said set of mobile terminals comprises (see Menon; paragraph 0185; "Each node manager 854, in turn, manages two or more network nodes 856. The network nodes 856 comprise the CPRUs 25, base

Art Unit: 2473

stations 30, ... "; figure 13; "Node (agent)" houses "SMP" which is the "subscriber management procedure 160 generates and supports network management access to subscriber information including, but not limited to, subscriber profiles ... subscription profiles include, but are not limited to. customer identification, customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned."): an elaboration agent configured to pre-process said set of measurement data derived form said application session (see Menon; paragraph 0168; "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications ... for purposes including, but not limited to, trouble-shooting and error management, asset management and system, service and functionality analysis"; paragraph 0188; "sports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management. Likewise, the agent applications layer 841 of the node element protocol stack 840 supports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management."); and a communication agent configured to send said set of pre-processed measurement data to said management and configuration subsystem (see Menon; paragraph 0228;

Art Unit: 2473

"The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 39, the architecture, wherein an additional subsystem is provided for managing a\_collection of measurement data resulting form said defined measurement campaign (see Menon; figure 9; paragraph 0167; "The network management layer 130 comprises a Network Node Management platform 114 for providing centralized network node management"), said additional subsystem (see Menon; figure 9; paragraph 0167; "network management layer 130") comprising at least one of a database (see Menon; paragraph 0167; "database") for storing said collection of measurement data and of a processing centre for processing said collection of measurement data (see Menon; paragraph 0167; "The NNM platform 114 provides standard network management functionality, including, but not limited to, configuration management, fault statusing and provisioning"; paragraph 185; "the manager of managers 852 is the Network Node Management (NNM) platform 114. The manager of managers 852 manages two or more node managers 854.").

Regarding claim 40, the architecture, wherein said at least one measuring agent housed by each mobile terminal of said set of mobile terminals (see Menon; figure 13; "Node (agent)" containing "SNMP" and "Agent applications") is configured to dialogue with at least one homologous measurement (i.e. of similar or same structure of same origin; see Menon; figure 12; figure 13; dialogue between "Agent" and "Manager" thus using homologous measurement) and management agent (see Menon; figure 12; "Nodes A-H" dialogue with "Node Manager" dialogue with "Manager of managers"; figure 13; "Network Manager" dialogues with "Node (agent)").

Regarding claim 42, The architecture, wherein said at least one measuring agent housed by each mobile terminal of said subset is configured to perform operations selected from the group of: conducting co-ordinated measurements on said telecommunication network (see Menon; paragraph 0227; "base station 30 of the wireless access system 10 or a base station 101 of the wireless access system 100 is operational, it performs a measurement collection functionality", thus a coordinated measurement), performing local storage and pre-processing operations according to a set of processing conditions of said telecommunication network, and managing a transfer (see Menon; paragraph 0228; "results, are reported to the wireless access system") of the collection of measurement data resulting from said defined measurement campaign (see Menon; paragraph 0228; "results") to said additional subsystem (see Menon; paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the

Art Unit: 2473

wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting.").

Regarding claim 43, the architecture, wherein said at least one measuring agent housed by mobile terminal of said subset is configured to conduct measurements selected from the group of: measuring (see Menon; paragraph 0227: "measurement collection functionality") quality and operating conditions of a set of radio access parameters of said subset, monitoring end-to-end transport performance in real traffic (see Menon; paragraph 0226; "Each CPRU 25, WARP 32 and base station 30 and 101 in wireless access systems 10 and 100 supports self-supervision functionality to detect failures due to equipment. processing, communications, quality of service and environmental conditions": paragraph 0228; "measurement collection functionality includes, but is not limited to, a determination of the uplink radio quality and signal strength on each base station 30 or 101 for all used, i.e., busy over-the-air channels, the signal strength on idle, i.e., not user, over-the-air channels, the success rate of over-the-air interface procedures, and the availability and usage of the base station's overthe-air resources."), monitoring end-to-end transport performance in artificial traffic, measuring and processing said subset to produce quality of service indicators at an application layer, and monitoring operating conditions of a set of resources of said subset and of said telecommunication network (see Menon: paragraph 0219; "CPRUs 25, WARPs 32 and base stations 30 and 101 of

wireless access systems 10 and 100 status their own hardware resources to the respective Operation and Maintenance Center (OMC) 72, including, but not limited to, a unique resource description that identifies the respective resource, i.e., the resource type, the version of the particular resource type, and the location of the resource. The hardware resource information of a respective CPRU 25, WARP 32 or base station 30 or 101 is provided to the system's OMC 72 upon the respective CPRU's, WARP's or base station's power on or reset. The hardware resource information of a respective CPRU 25, WARP 32 or base station 30 or 101 is also provided to the OMC 72 as part of a hardware failure status report").

Regarding claim 44, the architecture, wherein said at least one measuring agent house by each of said subset is configured to measure (see Menon; paragraph 0170; "collection, storage, and management of subscribers") a load state of at least one mobile terminal of said subset (see Menon; paragraph 0182; "subscriber activity information includes, but is not limited to, respective subscribers' usage, in time, of services supported by the wireless access system 10, or 100 ... ") and/or of the telecommunication network and to adapt a monitoring of quality of service in said telecommunication network to the measured load state (see Menon; paragraph 0370; "an adaptation function is used by both CPRUs 25 and WARPs, for coordinating, or otherwise interworking, between H.323 voice/fax signaling and the GSM-managed circuit signaling procedures").

Art Unit: 2473

Regarding claim 45, the architecture, wherein said management and configuration subsystem comprises at least one communication agent (see Menon; figure 13; "Node (agent)") ) that interfaces with said at least one measuring agent communication agent associated with said at least one measuring agent housed by each mobile terminal of said set of mobile terminals (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 46, the architecture, wherein said management and configuration subsystem comprises at least one communication agent (see Menon; figure 13; "Node (agent)") <a href="mailto:theating:thea

Art Unit: 2473

cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 47, the architecture, wherein said management and configuration subsystem <u>comprising</u> an interface for interfacing with a user (see Menon; paragraph 0199; "the OMC management platform 992 comprises a Graphical User Interface (GUI) 993 for operator interaction in the network management functionality.").

Regarding claim 48, the architecture, wherein said additional subsystem comprises a communication agent (see Menon; figure 13; "Node Manager") configured to communicate (see Menon; figure 13; "Remote or local connection") with at least one communication agent (see Menon; figure 13; "Agent Application") associated with said at least one measuring agent (see Menon; figure 13; "Agent Application" associated with "Node") housed by each mobile terminal of said set (see Menon; figure 12) of mobile terminals (see Menon; figure 13; "Node (Agent)").

Regarding claim 49, the architecture, wherein said additional subsystem comprises an interface for interfacing said architecture with at least one external system (see Menon; figure 9; a layered architecture. Architecture contains "Network Layer Management", "Subscriber Management Platform", "Gateway Management", "Router Management", and other external "management" that manages and collects data.).

Regarding claim 50, the architecture, wherein said at least one measuring agent housed by each mobile terminal of said subset is configured to transfer (see Menon; paragraph 0228; "results, are reported to the wireless access system") said collection of measurement data (see Menon; paragraph 0228; "results") to said additional subsystem (see Menon; paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting.").

Regarding claim 52, the architecture, wherein said <u>at least one</u> measuring <u>agent housed by each mobile terminal of said subset</u> dialogue with said <u>at least one</u> homologous <u>measurement and management agent</u> with a communication resource <u>selected from the group of</u>: information transport by means of SMS, TCP/IP transport (see Menon; figure 13; "TCP" and "IP" with "Remote or local connection"), and UDP/IP transport (see Menon; figure 13; "UDP" and "IP" with "Remote or local connection").

Regarding claim 53, the architecture, wherein said scheduling module is configured to perform at least one operation selected from the group of: defining the set of identifying characteristics of the defined measurement measuring campaign, identifying the subset of said set of mobile terminals to be subjected to said measuring campaign (see Menon; paragraph 0143; "subscriber profile comprises a respective subscriber identification, the subscribed for network

services and an assigned Quality of Service (QoS) level"; paragraph 0170; 
"subscriber registration procedure 152 includes ... the subscriber data includes, 
but is not limited to, a subscriber profile ... an example of a parameter associated 
with a subscriber profile is a Quality of Service (QoS) level subscriber for"), 
defining a set of measurements to be made and a set of quality of service 
indicators to be obtained, defining a set of characteristics of the set 
measurements to be made, and defining a set of contextual information 
associated with the set of measurements to be made and carried out by said at 
least one measuring agent housed by each mobile terminal of said subset.

Regarding claim 54, the architecture, wherein, in order to identify said subset of said set of mobile terminals, said scheduling module is configured to carry out operations selected from the group of: continuously searching for the subset of said set of mobile terminals meeting the set of identifying characteristics of the defined measuring campaign, recording said subset of said set of mobile terminals on an internal database, creating a measurement profile with information for conducting a set of measurements by the at least one measuring agent housed by each mobile terminal of said subset of said set of mobile terminals, activating the defined campaign on each mobile terminal of said subset of said set of mobile terminals, sending (see Menon; paragraph 0228; "results, are reported to the wireless access system") the set of measurements (see Menon; paragraph 0228; "results") collected from each mobile terminal of said subset of said subset of said set of mobile terminals (see Menon;

paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting."), identifying at least one mobile terminal that no longer meets the set of identifying characteristics of the defined measuring campaign, deactivating the defined measuring campaign (see Menon; paragraph 0228; "Further, any base stations 30 or 101 that was previously requested by the respective system 10 or 100 to cease measurement value reporting" thus deactivate the campaign), and deleting the measurement profile from said each mobile terminal of said subset of said set of mobile terminals.

Menon does not specifically disclose:

Regarding claim 38, interface with processes selected from a group of processes among processes for managing application sessions of said telecommunication network and processes for measuring operating conditions of said telecommunication network to derive therefrom a set of measurement data.

Korhonan more specifically discloses:

Regarding claim 38, interface with processes (see Korhonan; paragraph 0033; "IP Communication") selected <u>from a group of</u> processes (see Korhonan; paragraph 0033; "TCP/IP, TCP, Transmission Control Protocol, UDP/IP; UDP, user Datagram Protocol, Internet Control Message Protocol (ICMP)") for

managing application sessions (see Korhonan; paragraph 0033; "TCP/IP" is used to manage and establish application sessions) of said telecommunication network (see Korhonan; paragraph 033; "QoS" and "message" thus of a network) and processes for measuring (see Korhonan; paragraph 0021; "first of which is to pro-process and refine QoS data into a form suited for applications") operating conditions of said telecommunication network (see Korhonan; paragraph 0021; "activities include e.g. the calculation of transfer rate, standard deviations and calculation of percentages e.g. in loss of packets") to derive therefrom a set of measurement data (see Korhonan; paragraph 033; "QoS" and "message" thus of a network);

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Menon, as taught by Korhonan, thereby overcoming or alleviating drawbacks such as: being unable to guarantee a certain level of quality or service (QoS) (see Korhonan; paragraph 0003), the problem of the level of quality of data transfer varying considerably depending on location, time and network load (see Korhonan; paragraph 0003), and not being able to provide a guarantee of packets reaching their destination as IP-based packet switched network are basically "best effort" network and packets are transmitted to their destination within the limits allowed by the network (see Korhonan; paragraph 0004).

### Menon discloses:

Regarding claim 55, a method (see Menon; figure 1; "SMP" and "75"; paragraph 0182: "procedure") for monitoring quality of service (see Menon: paragraph 0182; "The subscriber management procedure 160 generates and supports network management access to subscriber information including, but not limited to, subscriber profiles, subscription activity and subscriber account balances. In an embodiment, subscription profiles include, but are not limited to, customer identification, customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned. In an embodiment, subscription activity information includes, but is not limited to, respective subscribers' usage, in time, of service supported by the wireless access system 10, or 100.") in a telecommunication network comprising a set of mobile terminals (see Menon; abstract; "telecommunications network") comprising : associating (see Menon: abstract: "a base station which provides wireless access for CPRUs" which are terminals; figure 16; multiple "Customer Premise Radio Units") each mobile terminal of said set of mobile terminals with at least one measuring agent (see Menon; paragraph 0185; "Each node manager 854, in turn, manages two or more network nodes 856. The network nodes 856 comprise the CPRUs 25, base stations 30, ... ": figure 13; "Node (agent)"

houses "SMP" which is the "subscriber management procedure 160 generates and supports network management access to subscriber information including, but not limited to, subscriber profiles ... subscription profiles include, but are not limited to, customer identification. customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned.") configured to interface with applications (see Menon; paragraph 0168; "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications ... for purposes including, but not limited to. trouble-shooting and error management, asset management and system. service and functionality analysis"; paragraph 0188; "sports the application functionality for network node management, including, but not limited to. configuration management, fault management, performance management, accounting management and security management. Likewise, the agent applications layer 841 of the node element protocol stack 840 supports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management.") wherein the mobile terminals comprise (see Menon; paragraph 0185; "Each node manager 854, in turn, manages two or more network nodes 856. The network nodes 856 comprise the CPRUs 25, base stations 30, ... "; figure 13: "Node (agent)" houses "SMP" which is the "subscriber management

Art Unit: 2473

procedure 160 generates and supports network management access to subscriber information including, but not limited to, subscriber profiles ... subscription profiles include, but are not limited to, customer identification, customer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned."); an elaboration agent configured to pre-process said set of measurement data derived from said application session (see Menon; paragraph 0168; "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications ... for purposes including, but not limited to. trouble-shooting and error management, asset management and system. service and functionality analysis"; paragraph 0188; "sports the application functionality for network node management, including, but not limited to. configuration management, fault management, performance management, accounting management and security management. Likewise, the agent applications layer 841 of the node element protocol stack 840 supports the application functionality for network node management, including, but not limited to, configuration management, fault management, performance management, accounting management and security management."); and a communication agent configured to send said set of pre-processed measurement data to said management and configuration subsystem (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100.

Art Unit: 2473

based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting") and conducting quality of service measuring campaigns (see Menon; paragraph 0170; "subscriber registration procedure 152 includes ... collection, storage, and management of subscriber, i.e. customer, data ... subscriber data includes, but is not limited to, a subscriber profile ... example of a parameter associated with a subscriber profile is a Quality of Service (QoS) level subscribed for, or otherwise assigned"; paragraph 0227; "perform a measurement collection functionality ... measurement collection functionality includes, but is not limited to, a determination of the uplink quality and signal strength to each base station ... the availability and usage of base station's over-the-air resources"), each quality of service measuring campaign involving a subset of said set of mobile terminals (see Menon; paragraph 02227; "on each base station 30 or 101 for all used") according to a set of identifying characteristics of a defined measuring campaign (see Menon; paragraph 0227; "the measurement collection functionality includes, but is not limited to, a determination fo the uplink radio quality and signal strength on each ...") and configuring, executing said defined measuring campaign, at least one measuring agent associated with each

mobile terminal of said subset according to said set of identifying characteristics (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 56, the method as claimed in claim 55, comprising the managing a collection of measurement data (see Menon; figure 9; paragraph 0167; "The network management layer 130 comprises a Network Node Management platform 114 for providing centralized network node management") and providing at least one of a database (see Menon; paragraph 0167; "database") for storing said collection of measurement data and a processing centre for processing said collection of measurement data (see Menon; paragraph 0167; "The NNM platform 114 provides standard network management functionality, including, but not limited to, configuration management, fault statusing and provisioning"; paragraph 185; "the manager of managers 852 is the Network Node Management (NNM) platform 114. The manager of managers 852 manages two or more node managers 854.").

Regarding claim 57, the method as claimed in claim 55, comprising configuring said at least one measuring agent associated with each mobile

terminal (see Menon; figure 13; "Node (agent)" containing "SNMP" and "Agent applications") of said set of mobile terminals to dialogue with at least one homologous measurement (i.e. of similar or same structure of same origin; see Menon; figure 12; figure 13; dialogue between "Agent" and "Manager" thus using homologous measurement) and management agent (see Menon; figure 12; "Nodes A-H" dialogue with "Node Manager" dialogue with "Manager of managers"; figure 13; "Network Manager" dialogues with "Node (agent)").

Regarding claim 58, the method as claimed in claim 56, wherein at least one terminal of said set of terminals comprises a mebile terminal (see Monon; paragraph 0027; "FIG. 13 depicts a generic management protocol architecture protocol for management of a network node in a wireless access network").

Regarding claim 59, the method, comprising configuring said at least one measuring agent associated with each mobile terminal of said subset to perform steps selected from the group of: conducting co-ordinated measurements on said telecommunication network (see Menon; paragraph 0227; "base station 30 of the wireless access system 10 or a base station 101 of the wireless access system 100 is operational, it performs a measurement collection functionality", thus a coordinated measurement), performing local storage and pre-processing operations according to a set of processing conditions of said telecommunication network, and managing a transfer (see Menon; paragraph 0228; "results, are reported to the wireless access system") of a collection of measurement data resulting from conducting the defined measuring campaign

(see Menon; paragraph 0228; "results") to an additional sub-system for managing the collection of the measurement data (see Menon; paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting.").

Regarding claim 60, the method, comprising configuring said at least one measuring agent associated with each mobile terminal of said subset to conduct measurements selected from the group of: measuring (see Menon; paragraph 0227; "measurement collection functionality") quality and operating conditions of a set of radio access parameters of said subset (see Menon; paragraph 0226; "Each CPRU 25, WARP 32 and base station 30 and 101 in wireless access systems 10 and 100 supports self-supervision functionality to detect failures due to equipment, processing, communications, quality of service and environmental conditions"; paragraph 0228; "measurement collection functionality includes, but is not limited to, a determination of the uplink radio quality and signal strength on each base station 30 or 101 for all used, i.e., busy over-the-air channels, the signal strength on idle, i.e., not user, over-the-air channels, the success rate of over-the-air interface procedures, and the availability and usage of the base station's over-the-air resources."), monitoring end-to-end transport performance in real traffic, monitoring end-to-end transport performance in artificial traffic. measuring and processing on said subset for the production of quality of service

indicators at <u>an application layer</u>, and monitoring operating conditions of <u>a set of resources</u> of said <u>subset</u> and of said <u>telecommunication</u> network (see Menon; paragraph 0219; "CPRUs 25, WARPs 32 and base stations 30 and 101 of wireless access systems 10 and 100 status their own hardware resources to the respective Operation and Maintenance Center (OMC) 72, including, but not limited to, a unique resource description that identifies the respective resource, i.e., the resource type, the version of the particular resource type, and the location of the resource. The hardware resource information of a respective CPRU 25, WARP 32 or base station 30 or 101 is provided to the system's OMC 72 upon the respective CPRU's, WARP's or base station's power on or reset. The hardware resource information of a respective CPRU 25, WARP 32 or base station 30 or 101 is also provided to the OMC 72 as part of a hardware failure status report").

Regarding claim 61, the method, comprising: measuring (see Menon; paragraph 0170; "collection, storage, and management of subscribers"), by means of said at least one measuring agent associated with each mobile terminal of said subset, a load state of at least one mobile terminal of said subset (see Menon; paragraph 0182; "subscriber activity information includes, but is not limited to, respective subscribers' usage, in time, of services supported by the wireless access system 10, or 100 ... ") and/or of said telecommunications network, and adapting a monitoring of quality of service in said telecommunication network to the measured load state (see Menon;

paragraph 0370; "an adaptation function is used by both CPRUs 25 and WARPs, for coordinating, or otherwise interworking, between H.323 voice/fax signaling and the GSM-managed circuit signaling procedures").

Regarding claim 62, the method, comprising the step of providing a subsystem for the management and configuration of the <u>quality of service</u> measurement campaigns <u>that interfaces</u> with said <u>at least one</u>measuring <u>agent associated with each mobile terminal</u> of said set <u>of mobile terminals</u> (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 63, the method, comprising: providing a sub-system for the management and configuration of the <u>quality of service</u> measurement campaigns, and providing an additional sub-system for managing the collection of measurement data <u>that interfaces</u> with said sub-system for the management and configuration of the <u>quality of service</u> measurement campaigns (see Menon; paragraph 0228; "The base stations' measured, and /or collected values, or results, are reported to the wireless access system 10 or 100, based on a network configurable reporting period. Any base station 30 and 101 may also be

Art Unit: 2473

requested by the respective system 10 or 100 to cease measurement value reporting. Further, any base station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Regarding claim 64, the method, comprising the step of providing a subsystem for the management and configuration of the <u>quality of service</u> measurement campaigns <u>that interfaces</u> with a user (see Menon; paragraph 0199; "the OMC management platform 992 comprises a Graphical User Interface (GUI) 993 for operator interaction in the network management functionality.").

Regarding claim 65, the method, comprising providing an additional subsystem for managing the collection of measurement data configured to communicate (see Menon; figure 13; "Remote or local connection") with said at least one measuring agent (see Menon; figure 13; "Agent Application") associated with each mobile terminal (see Menon; figure 13; "Node (Agent)") of said set of mobile terminals (see Menon; figure 12).

Regarding claim 66, the method, comprising providing an additional subsystem for managing the collection of measurement data configured to interface with at least one external system (see Menon; figure 9; a layered architecture.

Architecture contains "Network Layer Management", "Subscriber Management Platform", "Gateway Management", "Router Management", and other external "management" that manages and collects data.).

Art Unit: 2473

Regarding claim 67, the method, comprising: providing an additional subsystem for managing the collection of measurement data, and configuring said at least one measuring agent associated with each mobile terminal of said subset to transfer (see Menon; paragraph 0228; "results, are reported to the wireless access system") said collection of measurement data (see Menon; paragraph 0228; "results") to said additional sub-system (see Menon; paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting.").

Regarding claim 69, the method, comprising configuring said at least one measuring agent associated with each mobile terminal of said set of mobile terminals for dialoguing with said homologous measurement and management agent with a communication resource selected from the group of information transport by means of SMS, TCP/IP transport (see Menon; figure 13; "TCP" and "IP" with "Remote or local connection"), and UDP/IP transport (see Menon; figure 13; "UDP" and "IP" with "Remote or local connection").

Regarding claim 70, the method, wherein conducting said quality of service measurement campaigns in turn comprises at least a step selected from the group of: defining the set of identifying characteristics of the defined measuring campaign, identifying the subset of said set of mobile terminals to be subjected to said defined measuring campaign (see Menon; paragraph 0143;

"subscriber profile comprises a respective subscriber identification, the subscribed for network services and an assigned Quality of Service (QoS) level"; paragraph 0170; "subscriber registration procedure 152 includes ... the subscriber data includes, but is not limited to, a subscriber profile ... an example of a parameter associated with a subscriber profile is a Quality of Service (QoS) level subscriber for"), defining a set of measurements to be made and a set of quality of service indicators to be obtained, defining a set of characteristics of a set of measurements to be made, and defining contextual information associated with said set of measurements to be made and carried out by said at least one measuring agent associated with each mobile terminal of said subset.

Regarding claim 71, the method, <u>further comprising</u>, in order to identify said <u>subset</u> of said set of <u>mobile</u> terminals, <u>the</u> steps selected from the group of: continuously searching for the <u>subset of said set of mobile</u> terminals meeting the <u>set of</u> identifying characteristics of the <u>defined measuring</u> campaign, recording said <u>subset of said set of mobile</u> terminals on an internal database, creating a measurement profile with information for conducting <u>a set of</u> measurements by <u>the at least one</u> measuring agent <u>associated with each mobile terminal of said subset</u>, activating the <u>defined measuring</u> campaign on <u>each mobile terminal of said subset</u>, sending (see Menon; paragraph 0228; "results, are reported to the wireless access system") the <u>set of measurements</u> (see Menon; paragraph 0228; "results") collected from <u>each mobile terminal of said subset of said set of mobile terminals (see Menon;</u>

Art Unit: 2473

paragraph 0228; "base stations' measured, and/or collected values, or results, are reported to the wireless access system 10 or 100, based on network configurable reporting period. Any base station 30 and 1010 may also be requested by the respective system 10 or 100 to cease measurement value reporting."), identifying at least one mobile terminal that no longer meets the set of identifying characteristics of the defined measuring campaign, deactivating the defined measuring campaign (see Menon; paragraph 0228; "Further, any base stations 30 or 101 that was previously requested by the respective system 10 or 100 to cease measurement value reporting" thus deactivate the campaign), and deleting the measurement profile from each mobile terminal of said subset of said set of mobile terminals.

Regarding claim 72, a telecommunication network (see Menon; figure 1; "network") comprising, <a href="the-architecture">the-architecture</a> (see Menon; figure 9; "item "110" is the "management" architecture for "monitoring") as claimed in claim 38, and associated with the <a href="telecommunication">telecommunication</a> network (see Menon; figure 9; "item "110" is associated with "network").

Regarding claim 73, the telecommunication network, comprising at least an application server housing at least <u>one</u> measuring agent (see Menon; figure 13; "agent application" and "node (agent)") <u>that interacts</u> with said architecture.

Regarding claim 74, a computer<u>-readable medium storing a computer</u>

<u>program product for execution on a processor.</u> (see Menon; figure 13;
"application", thus instructions embedded on a computer readable medium) the

Art Unit: 2473

computer program product comprising portions of software code for implementing the method as claimed in any one of claims \$5-74\_55-57 and 59-

71.

 Recording elgim 76 the method as elgimed in elgim 55 wherein the messuring seems housed within the set of terminals (see Menon: paragraph 0185: "Each node manager 854 in turn, manager two-or more network nodes 856 The network nedec 856 comprise the CPRUs 25-base stations 30 .....": figure 13: "Node (egent)" houses "SMP" which is the "subscriber management propedure 160-generates and cupports notwork management access to subscriber information including, but not limited to, subscriber profiles .... subscription profiles include, but are not limited to customer identification. oustomer service support requests and the Quality of Service (QoS) subscribed for, or otherwise assigned ") comprise: a measuring agent configured to interface with a application (see Monon; paragraph 0168; "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications ... for purposes including, but not limited to, trouble cheeting and error-management-asset management and system, service and functionality analysis";-paragraph-0188; "sports-the-application-functionality-for-notwork-node management-including-but-not-limited to-configuration management-fault management-performance-management-accounting-management-and-accurity management. Likewise, the agent applications laver 841 of the node element protocol stack 840 supports the application functionality for notwork node

Art Unit: 2473

management, including, but not limited to, configuration management, fault management, performance management, accounting management and ecourity management,");-an-elaboration-agent-configured to pre-process-said-set-of measurement data derived from eaid application session (see Merion, paragraph Q163: "the NNM platform 114 provides standard APIs (Application Platform Interfaces) which allow attachment of third party applications .... for purposes including but not limited to trouble-shooting and orror management, accet monogement and evolom, service and functionality analysis"; paragraph 0188; "eports the application functionality for network node management, including but not limited to, configuration management, fault management, performance management, accounting management and socurity management. Likewise the agent-applications layer-841-of the nede element-protocol-clack-840 supports the application functionality for network node management, including, but not limited to contiguration management fault management performance management. accounting management and accurity management."); and a communication agent configured to condecid act of pre-processed measurement data to cald management and configuration subsystem (see Monon: paragraph 0228; "The base-stations'-measured-and-for-collected-values-or-results-are-reported-to-the wireless-access evetem 10 or 100-based on a network-configurable recerting period. Any base station 30 and 101 may also be requested by the respective system 10 or 100 to coase measurement value reporting. Further, any base

Art Unit: 2473

station 30 or 101 that was previously requested to cease measurement value reporting may be instructed to resume measurement value reporting").

Menon does not specifically disclose:

Regarding claim 55, interface with processes selected from a group of processes for managing application sessions of said telecommunication network and processes for measuring operating conditions of said telecommunication network to derive therefrom a set of measurement data.

Regarding claim 75, wherein the application is a precess for managing an application session of said telecommunication network and to derive therefrom a set of measurement data.

Korhonan more specifically discloses:

Regarding claim 55, interface with processes (see Korhonan; paragraph 0033; "IP Communication") selected <a href="from a group of">from a group of</a> processes (see Korhonan; paragraph 0033; "TCP/IP, TCP, Transmission Control Protocol, UDP/IP; UDP, user Datagram Protocol, Internet Control Message Protocol (ICMP)") for managing application sessions (see Korhonan; paragraph 0033; "TCP/IP" is used to manage and establish application sessions) of said <a href="telecommunication">telecommunication</a> network (see Korhonan; paragraph 033; "QoS" and "message" thus of a network) and processes for measuring (see Korhonan; paragraph 0021; "first of which is to pro-process and refine QoS data into a form suited for applications") operating conditions of <a href="said telecommunication">said telecommunication</a> network (see Korhonan; paragraph 0021; "activities include e.g. the calculation of transfer rate, standard deviations and

Art Unit: 2473

calculation of percentages e.g. in loss of packets") to derive therefrom a set of measurement data (see Korhonan; paragraph 033; "QoS" and "message" thus of a network);

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Menon, as taught by Korhonan, thereby overcoming or alleviating drawbacks such as: being unable to guarantee a certain level of quality or service (QoS) (see Korhonan; paragraph 0003), the problem of the level of quality of data transfer varying considerably depending on location, time and network load (see Korhonan; paragraph 0003), and not being able to provide a guarantee of packets reaching their destination as IP-based packet switched network are basically "best effort" network and packets are transmitted to their destination within the limits allowed by the network (see Korhonan; paragraph 0004).

Application/Control Number: 10/579,293 Art Unit: 2473

Claims 51 and 68 rejected under 35 U.S.C. 103(a) as being unpatentable over
 Menon (US 2001/0001268) in view of Korhonan (EP 1 304 831 A2), and further in view of Bellifemine ("JADE: Java Agent Development Framework").

Menon in view of Korhonan disclose:

Regarding claim 51, the architecture (see Menon; figure 1; "SMP" and "75"; figure 9).

Regarding claim 55, the method (see Menon; figure 1; "SMP" and "75"; paragraph 0182; "procedure").

Menon in view of Korhonan do not specifically disclose:

Regarding claim 51, the architecture, wherein said <u>at least one</u> measuring agent house by each <u>mobile terminal of said subset of mobile terminals</u> <u>operates</u> according to Jade technology.

Regarding claim 68, the method, wherein said at least one measuring agent house by each mobile terminal of said subset of mobile terminals operates according to Jade technology.

Bellifemine more specifically discloses:

Regarding claim 51, the architecture, wherein said <u>at least one</u> measuring <u>agent</u> (see Bellifemine; slide 3; "Agent") <u>house by each terminal of said subset of</u> terminals operates according to Jade technology (see Bellifemine; slide 1:

"JADE: Java Agent Development Framework"; slide 5 "FIPA: Conceptual Model of an Agent Platform"; "Agent Platform" for "Services").

Regarding claim 68, the method, wherein said <u>at least one</u> measuring <u>agent</u> (see Bellifemine; slide 3; "Agent") <u>house by each terminal of said subset of terminals operates</u> according to Jade technology (see Bellifemine; slide 1; "JADE: Java Agent Development Framework"; slide 5 "FIPA: Conceptual Model of an Agent Platform": "Agent Platform" for "Services").

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify the invention of Menon in view of Korhonan, as taught by Bellifemine, thereby using a standard thus allowing for the enabling factor for openness and heterogeneity (see Bellifemine; slide 3); allowing for agents from several designers, several vendors, or several organizations (see Bellifemine; slide 3); providing a standard way of interpreting communication between agents that respect the intended meaning of the communication (see Bellifemine; slide 4).

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ADAM DUDA whose telephone number is (571)270-5136. The examiner can normally be reached on Mon. - Fri. 9:30 a.m. - 7:00 p.m..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kwang B. Yao can be reached on (571) 272 - 3182. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
